

**CIS1910 Discrete Structures in Computing (I)**  
Winter 2019, Lab 3 Notes

*Here are recommended practice exercises. Many have been covered in Lab 3.*

**I.**

1. The unary operation  $(\{0,1\}, \{0,1\}, \{(0,0), (1,0)\})$  can be represented by a diagram, but it can also be represented by a table:

element	image
0	0
1	0

Represent each possible unary operation on  $\{0,1\}$  by a table.

2. What are all the binary operations on  $\{0,1\}$ ?
3. Let  $n$  be a positive integer. How many  $n$ -ary operations can we define on  $\{0,1\}$ ?

**II.**

Consider a binary operation  $\star$  on a set  $S$ .

1. Assume  $x, y$  and  $z$  are three elements of  $S$  such that  $x \star y = x \star z$ . Can we then write  $y = z$ ?
2. Let  $u$  and  $v$  be two elements of  $S$ . Can we write  $u \star v = v \star u$ ?
3. Let  $u, v$  and  $w$  be three elements of  $S$ . Can we write  $u \star (v \star w) = (u \star v) \star w$ ?
4. Assume  $n$  is an element of  $S$  such that:

$$\text{for any } u \text{ in } S \text{ we have } u \star n = n \star u = u.$$

As seen in class, we then say that  $n$  is a **neutral element** for  $\star$ .  
Show that no other element of  $S$  can be a neutral element for  $\star$ .

5. Assume  $a$  is an element of  $S$  such that:

$$\text{for any } u \text{ in } S \text{ we have } u \star a = a \star u = a.$$

As seen in class, we then say that  $a$  is an **absorbing element** for  $\star$ .  
Show that no other element of  $S$  can be an absorbing element for  $\star$ .

**III.**

Consider a set  $B$ , a unary operation  $\bar{\phantom{x}}$  on  $B$ , and two binary operations  $+$  and  $\cdot$  on  $B$ .

Assume  $0$  is the neutral element for  $+$  and  $1$  is the neutral element for  $\cdot$ . For any  $x$  of  $B$  we have:

$$x+0=0+x=x \quad (1a)$$

$$x \cdot 1=1 \cdot x=x \quad (1b)$$

Assume, moreover, that for any  $x, y$  and  $z$  of  $B$  we have:

$$x+y=y+x \quad (2a)$$

$$x \cdot y=y \cdot x \quad (2b)$$

$$(x+y)+z=x+(y+z) \quad (3a)$$

$$(x \cdot y) \cdot z=x \cdot (y \cdot z) \quad (3b)$$

$$x+(y \cdot z)=(x+y) \cdot (x+z) \quad (4a)$$

$$(x \cdot y)+z=(x+z) \cdot (y+z) \quad (4b)$$

$$x \cdot (y+z)=(x \cdot y)+(x \cdot z) \quad (4c)$$

$$(x+y) \cdot z=(x \cdot z)+(y \cdot z) \quad (4d)$$

$$x + \bar{x} = \bar{x} + x = 1 \quad (5a)$$

$$x \cdot \bar{x} = \bar{x} \cdot x = 0 \quad (5b)$$

**0.** (a) (1a) means that  $0$  is the neutral element for  $+$  and (1b) that  $1$  is the neutral element for  $\cdot$ . What about (2a) to (4d)? (b) If  $\cdot$  is given a higher precedence than  $+$ , some brackets in these equalities become unnecessary. Which ones? (c) If  $\cdot$  and  $+$  are given the same precedence and left-to-right associativity is assumed, some brackets in these equalities become unnecessary. Which ones?

**1.** Show that  $0+0=1 \cdot 0=0 \cdot 1=0$  and  $1+1=1 \cdot 1=1$ .

**2.** Show that  $1=\bar{0}$ .

**3.** Show that for any two elements  $x$  and  $y$  of  $B$ , if  $x+y=1$  and  $x \cdot y=0$  then  $y=\bar{x}$ .

**4.** Show that for any  $x$  of  $B$  we have  $x=\overline{\bar{x}}$ .

**5.** Show that for any  $x$  of  $B$  we have  $x+\bar{x}=x$ .

**6.** Show that for any  $x$  of  $B$  we have  $1+x=x+1=1$ .

**7.** Show that for any  $x$  of  $B$  we have  $0 \cdot x=x \cdot 0=0$ .

**8.** Show that for any two elements  $x$  and  $y$  of  $B$  we have  $\bar{x} \cdot \bar{y} = \overline{x+y}$ .
